Training, Consulting and Mentoring

# EA for Teams

Expanding your use of Sparx Enterprise Architect across your organisation

Special for  
EA Global Summit 2020

eaDocX  
smart documents

Model  
Expert

# My biases – the ones I know about

- EA user since v3.5
- Business analyst, process modeller, team leader, consultant
  - So I don't know SysML or Archimate
- I would rather spend 4 hours writing a script than 20 minutes doing something dull
  - BIG bias towards tools
- EA drives me CRAZY
  - But I never use anything else
- Co-founder of the EA User groups
- I have Used EA in teams of 2-20
- I have worked with EA teams of 2-200
- Collaborated with Nizam in early days of Prolaborate

# Agenda – today

---

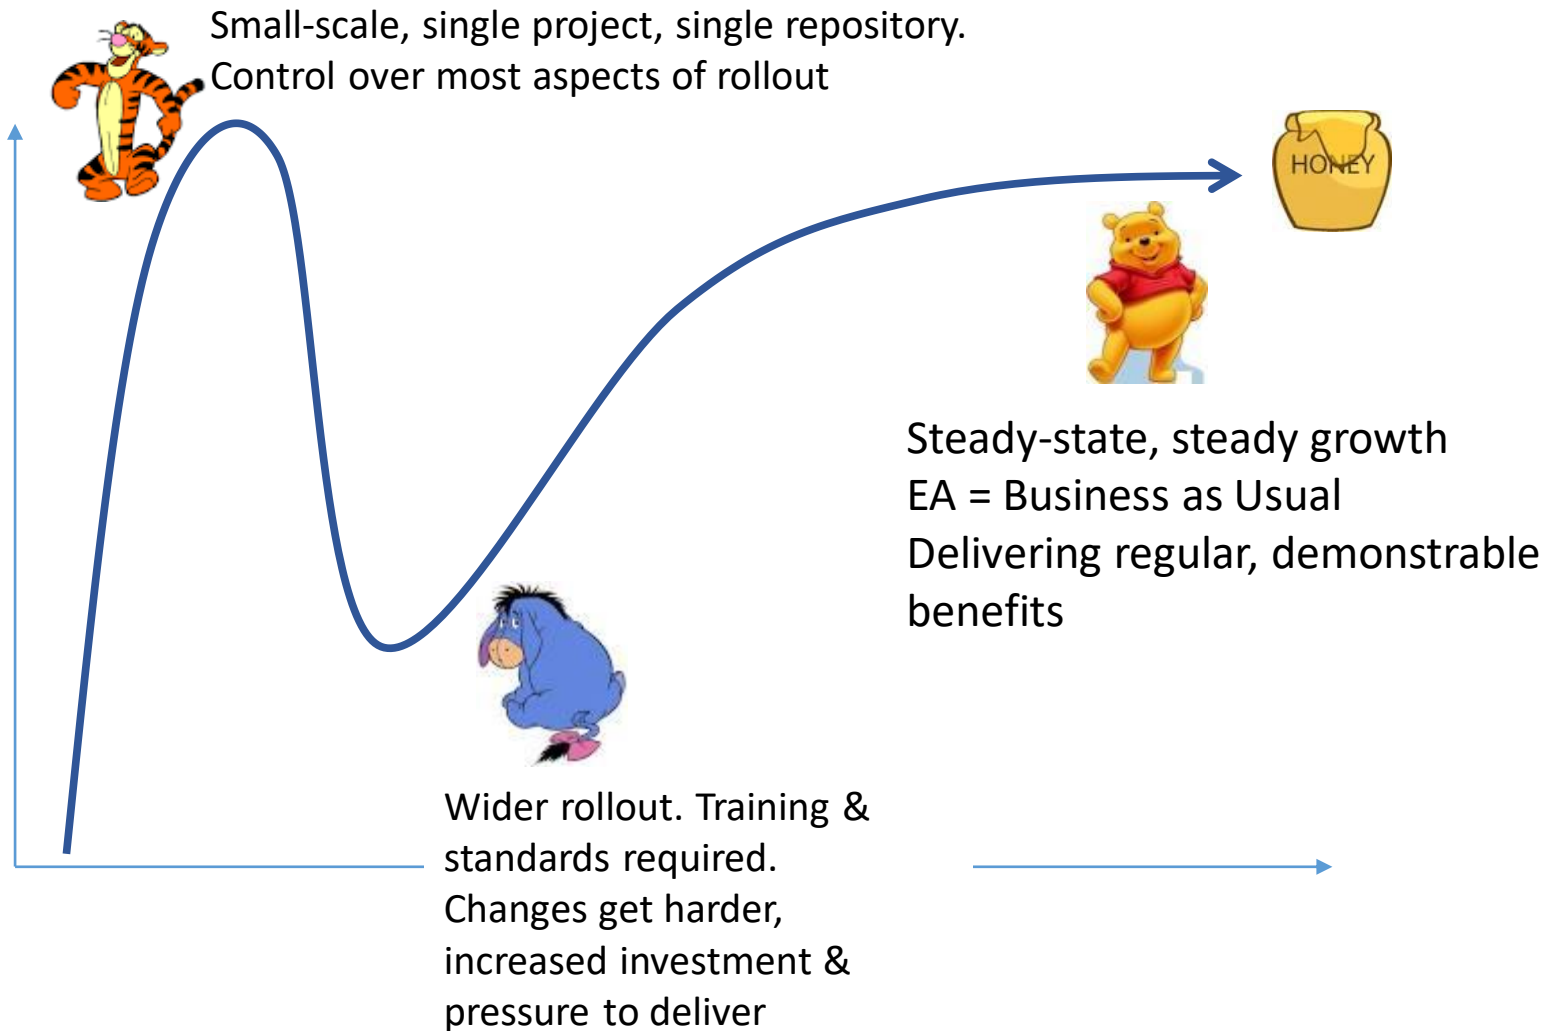

1. Mechanics of growing
2. Baselines, DIFF, Version control & auditing
3. Reference Data
4. Reusable Asset Server
5. Security
6. Harvesting
7. Keys to Success
8. Governance approaches
9. Partitioning
10. (other stuff)

All day workshop

*“Awareness, not expertise”*

# Evolution of a typical EA rollout

# Evolution of *your* EA rollout

# EA for Teams

## Keys to success

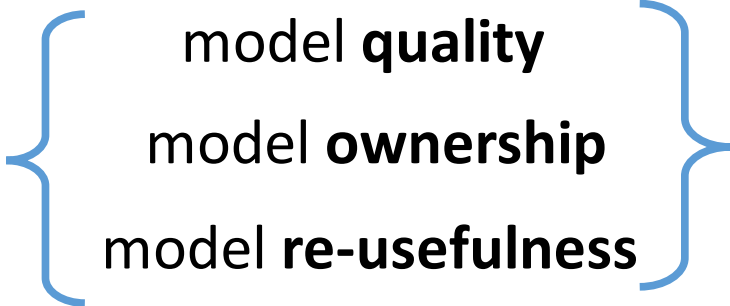

Being successful with EA doesn't stop with buying more licences. Organisations which make a difference using EA share some common approaches

# Approach

---

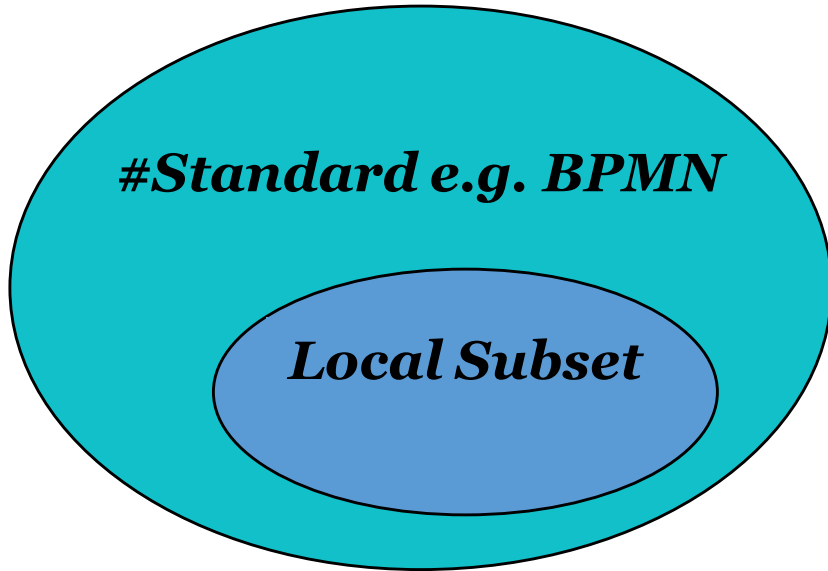

- Find a **senior manager** who is a believer

- Put 
  - model **quality**
  - model **ownership**
  - model **re-usefulness** on some people's **job objectives**, and **measure it**

- Get a group of enthusiasts
- EA models = part of a process
- Sell it to the rest of the organisation – by proving it!

# Success - 2

*"Aren't I clever – I can use ALL the (..)ML notation..."*

~~MML~~

## Pick your subset

- forbid everything else
- ..but allow some users to experiment
- ..and DOCUMENT your decisions

Model  
Expert

Document best practice

...and worst  
(anonymously)

## Key to the Consistency of models, and the **trust** of potential re-users

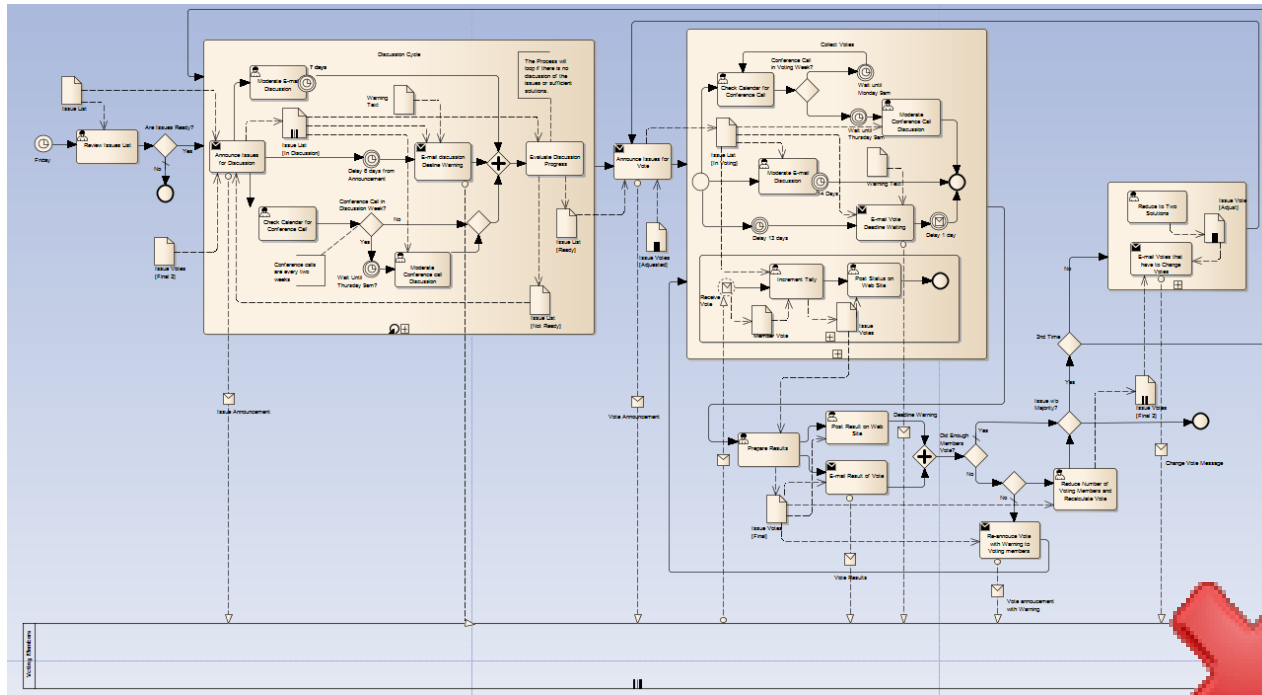

- Structural standards
  - What kinds of ‘things’ and ‘relationships between things’ are allowed
  - Might be verifiable mechanically
    - Model validation rules, scripting, **ModelExpert**
- Stylistic standards
  - E.g. ‘how shall we write user stories’,
  - ‘what’s a good style for Requirements’
  - What’s a sensible way to draw diagrams?
  - Cannot be verified mechanically – wet-ware solution only

# Success - 4

## Create re-useful models

Avoid 'look at me' diagrams:

- Looks clever – isn't
- Usually means author can't/won't make into several smaller pictures
- Can't be printed => can't be re-used or reviewed without EA
- MAY be useful as a "working out" diagram – not for public consumption

# Success - 5

Develop a plan for doing everything in EA

Keep everyone on the same plan

Slow rollout, unresponsive to new discoveries

Let new teams do their own thing, but monitor them closely

Prove they can deliver, starting small, getting larger

Steady evolution of a common approach

No plan for how to do stuff in EA

New teams have their own approaches

Can't combine into a single version of the truth

## The BIG PLAN

## The Organic PLAN

# EA for Teams

# Scaling

Pull existing knowledge into EA to make it more useful, faster

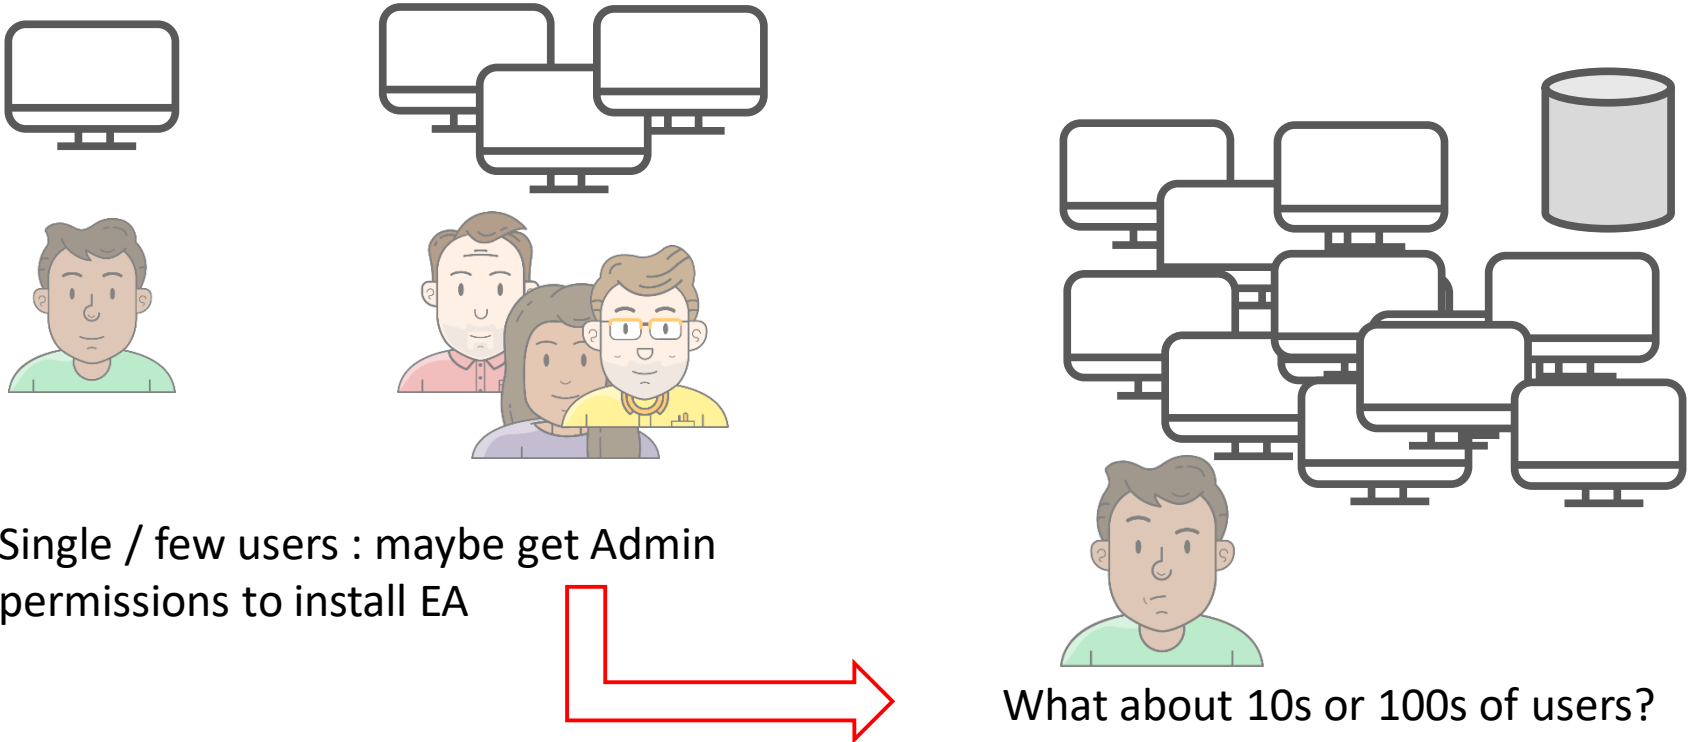

# Scaling - 1

---

EAPX	1
Shared EAPX	<5
Master Replica	<10
DBMS (+Cloud)	100s – 1000s
Federated Servers	??
Full cloud deployment	$\infty$

# Scaling - 2

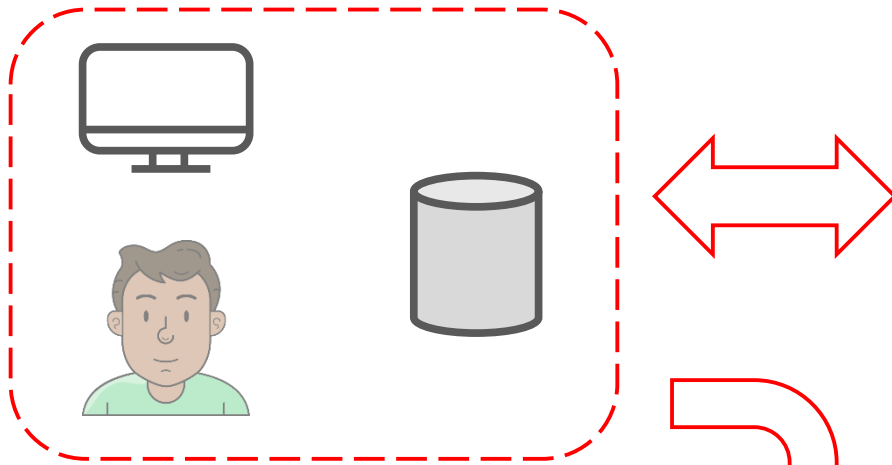

*“A thick client solution in a browser world..”*

(chief architect of multi-national, \$MMM project)

# Scaling - 3

Do all your knowledge community  
NEED EA on their desktop ?

...or would a web-based, read-mostly  
solution be easier/faster/better/cheaper ?

...or if you MUST have  
documents, make  
them interactive

**eaDocX**  
smart documents

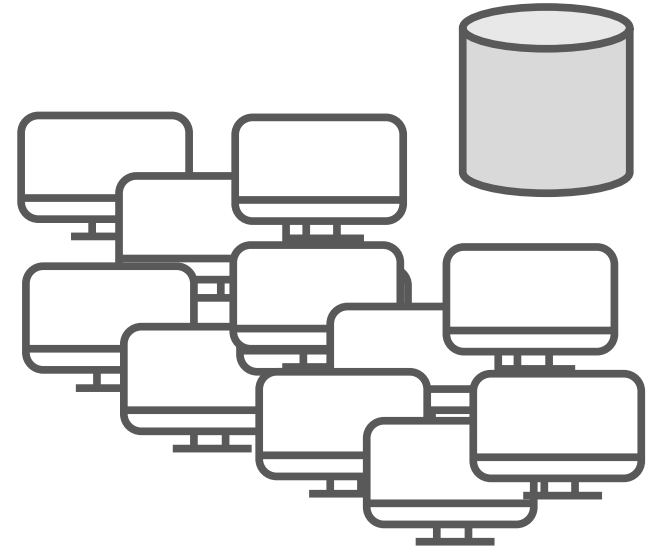

Other web tools

# Scaling - 4

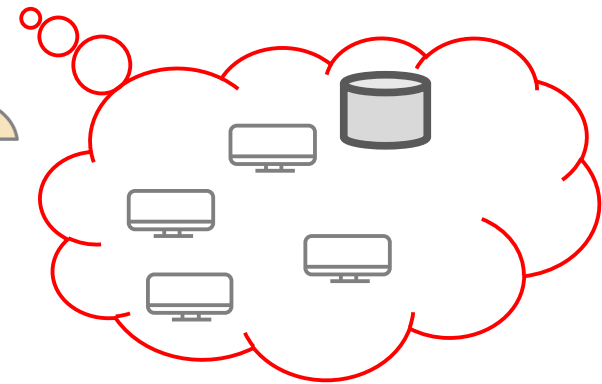

## Options

- Become friends with your IT desktop team
  - Still hard to install new versions of EA...
  - ...Or addins

## Cloud hosting

- Each EA user has their own VM
- Image can change – once, for everyone
- Allows easier updates to EA and addins
- Run offsite
- Maintained by experts

<https://prolaborate.sparxsystems.com/enterprise-architect-models-on-cloud>

<https://www.mosaicisland.co.uk/>

# Scaling 5 – Simplify EA

---

*“This new EA thing is really complicated...”*

*“OK, we can make it simpler”*

- LOTS of ways that the EA user experience can be simplified
- Perspectives, MDGs, Model expert, removing menu options
- PLEASE do this – initial shock of EA can be an issue

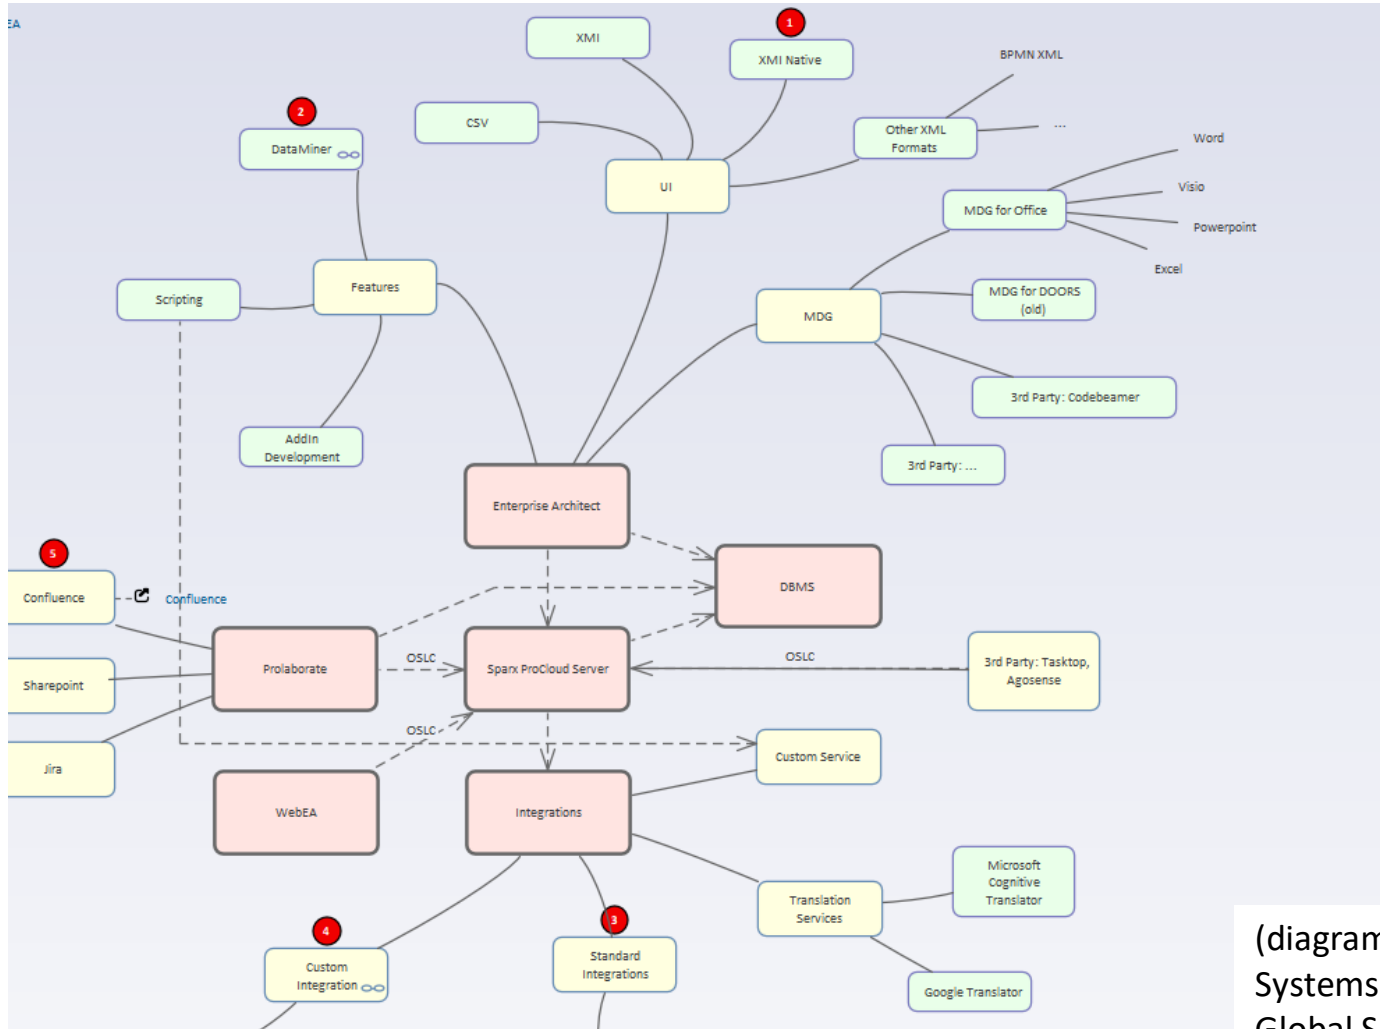

## EA for Teams

# Harvesting & Integrating

Pull existing knowledge into EA to make it more useful, faster

# Harvesting & Integrations

(diagram from Peter Lieber, Sparx Systems Central Europe, in EA Global Summit 2020)

# Harvesting - Where to start

---

- All kinds of data....
  - Requirements / solutions from previous projects
  - Standards – which new project might refer to
  - Test results
  - Settings from existing solutions (!)
  - Org charts
  - Project 'boilerplate' introductions
- ...anything else you
  - know to be true and which
  - WILL be useful (not *might* be )

# Harvesting & Integrations

---

- **2-way updates** are harder, but MUCH more useful
- See Peter Lieber's talk on integrations
  - Via Pro Cloud Server to lots of tools
  - Via Prolaborate to lots more...
- Make sure data has an owner, a lifecycle, quality checking, and a purpose

## EA for Teams

# Governance Approaches

If you're going to use a shared repository, you'll need to make sure everyone can play nicely together. And even re-use each other's knowledge. Here are some things to think about.

*“Governance is BORING...”*

*....until you spend all week making some changes, then find you started from the wrong place...”*

# Governance - 1

LOTS

LITTLE

Amount of knowledge sharing

## Examples:

- Designs based on an existing Architecture
- Processes using other processes

aModel != bModel

## Examples:

- New requirements gathering
- New user stories

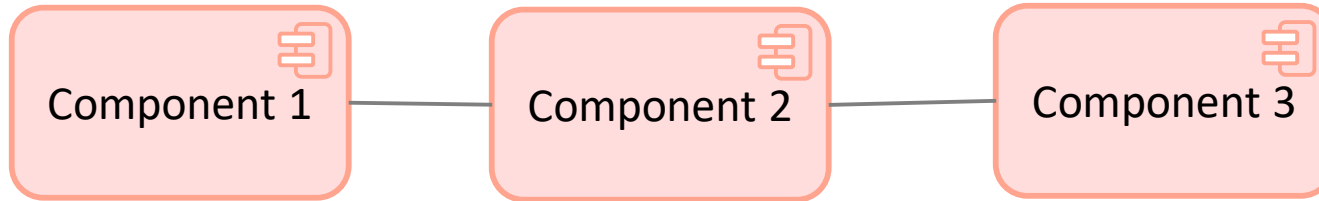

## Governance:

- Very strict – adding to the architecture is a big deal (steady state)
- Instance approach?

## Governance:

- Style & structure only

# Instance-based team working

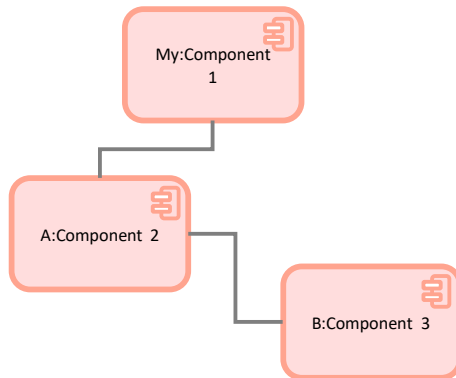

**Our Architecture** – read-mostly, updates tightly controlled

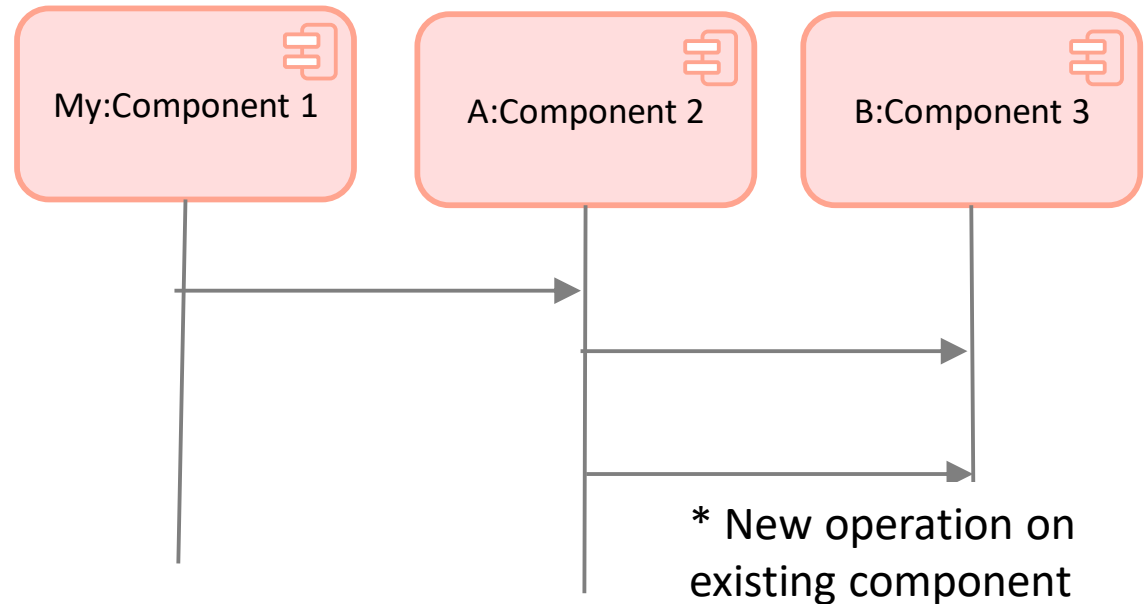

---

## My Project

### Static design

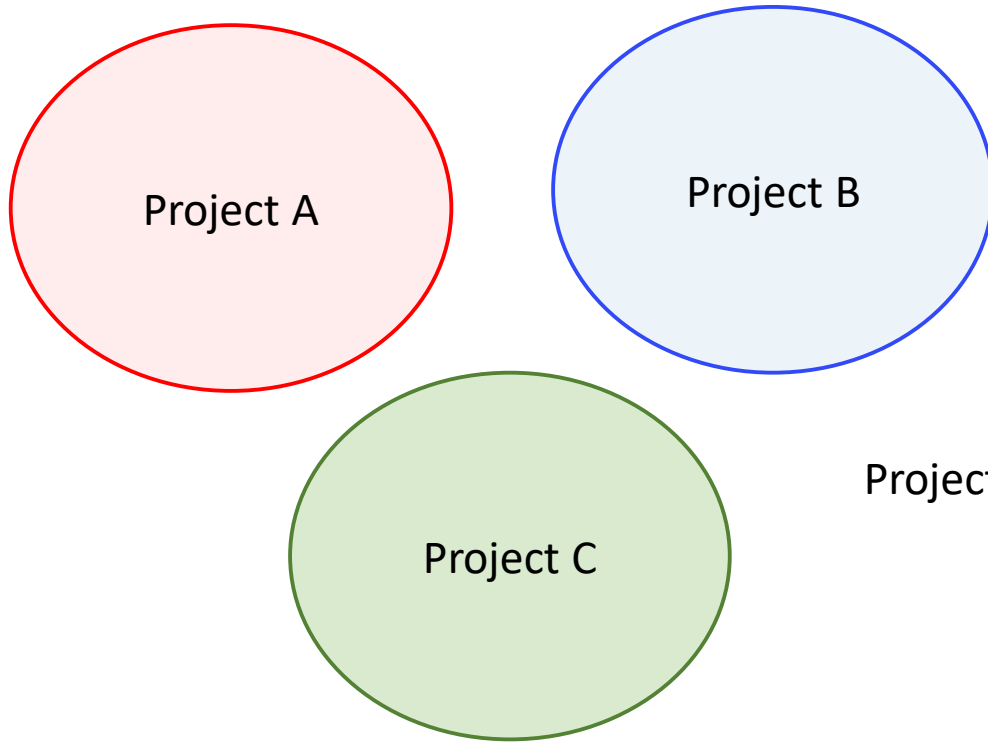

### Dynamic design

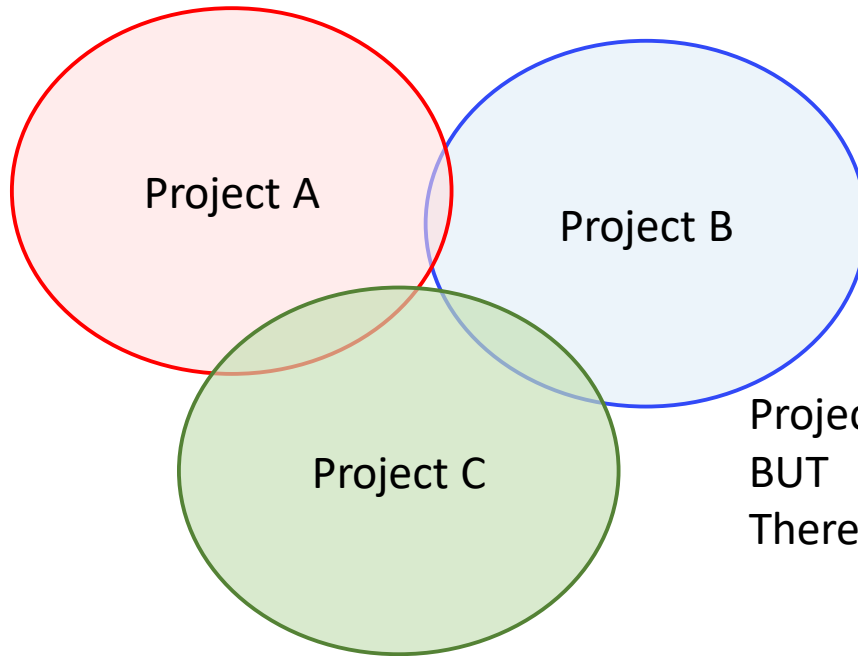

# Write-mostly modelling

Projects are mostly creating new stuff

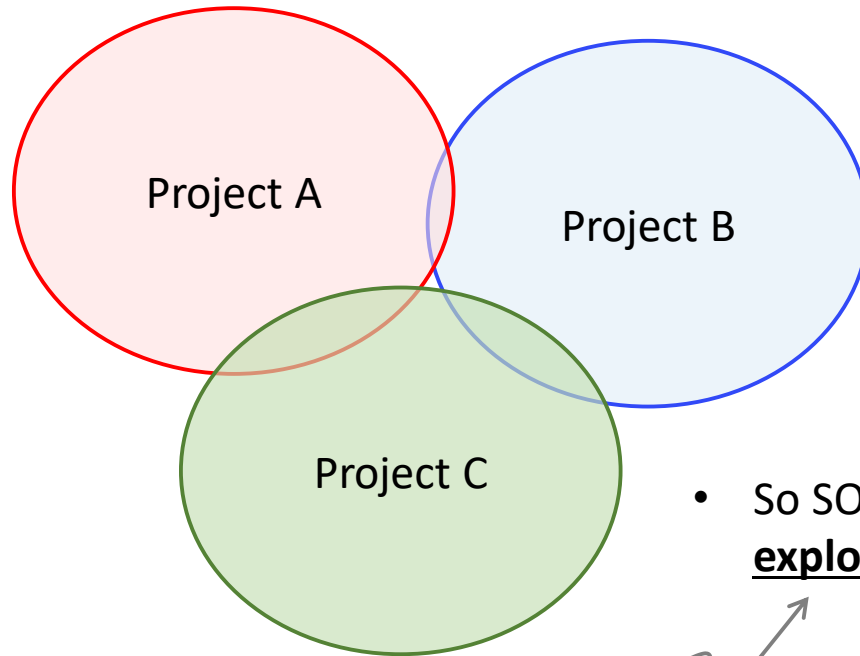

# Write-mostly modelling

Projects are mostly creating new stuff  
BUT  
There will usually be overlaps:

- Processes use common organisation roles
- Requirements have common stakeholders
- ...etc...

# Write-mostly modelling

- So SOME governance will still be needed to **exploit** overlaps
- Can be lightweight

*Same stakeholder having requirements in different projects is a useful thing to know. Try to find-out that using Visio...*

# Governance – 3 – Best time to fix

- Fixing AFTER modelling has finished is bad and hard
  - BAD – team may already have got it wrong
  - HARD – what were they really trying to do?
  - HARD – who pays ?
- Fixing in-flight is also hard – but not so much
  - Need to understand the rules before they start
  - Apply rules as they model: MDG, Profiles, Model Expert etc
  - Check before they are complete
    - Model Expert, and ....

# Summary

## Approach

- Get a senior sponsor
- Make use of EA part of a process

## Scaling

- Lots of options
- If you are serious, look at remote hosting

## Harvesting

- Do some – fill our model with interesting stuff
- Lots of technical options

## Governance

- Pick an approach which suits your modelling
- Fix sooner, not later

I'm available to help your team.
